

HEINLEHMANN

The protection deck as a scale grid with/without finger screen. The lower deck as a flip flow screen for trouble-free fine separation.

The Recycling LIWELL®

for „tough“ applications

Liwell® Spannwell screening machine type KT/EDS

The scale grid ...

- causes a slide of the screening material on the screen panel. Finest particles fall off backwards through the conical slit openings in opposition to the screen direction.
- leads coarse material especially with problematic particle shape (stem shaped particles, foams etc.) over the scales to the discharge.
- prevents clogging of the screen perforation effectively.

The finger screen ...

- offers a high screening efficiency with a self cleaning effect through its big open area.
- avoids effectively clogging through fibrous and difficult to screen particles because of the opening in screen direction and the flexible fingers.

The scale grid alone or in combination with the finger screen offers an efficient protection of the lower deck (flip flow - screening) for the important fine separation of many recycling materials like matured timber, waste incineration slag, electric and electronic scrap, domestic and commercial waste, compost etc.

See for yourself – let us make a test run!
